

API Integration & Tally Export

How e-Invoicing (IRN + E-Way Bill) and Tally accounting will run automatically from inside the CRM — and a five-day plan to set it up.

Prepared for: Prokon
Scope: 3 branches · 1 Tally company
Delivery: 5 working days
Version: 1.0

01 Two automations, one source of truth

A · COMPLIANCE

GSP API — E-Invoice (IRN) & E-Way Bill

The CRM itself fetches the legally valid IRN, acknowledgement number, signed QR code and E-Way Bill number from the Government portal, through our GSP partner. No separate portal login, no copy-paste.

₹29,500 / year · 4,000 API calls

B · ACCOUNTING

Tally Export — books stay in TallyPrime

Every CRM invoice is converted into TallyPrime vouchers with matching ledgers, GST rate buckets and invoice references. One file, imported in one go — Sales, GST and party ledgers update together.

₹0 — Tally's import gateway is built in

The rule both follow: the CRM is the only place a bill is created. Nothing is re-typed in the Government portal or in Tally — so the same figures reach the tax department and your books.

02 The process, end to end

- 1** Invoice created in the CRM — any of the three branches, exactly as today.

2A Validation, then a secure server-to-server call to the GSP API. Credentials never reach the browser.

3A Government returns IRN, acknowledgement number, signed QR and E-Way Bill number; the invoice is marked Complete.
- 2B** Export engine converts the invoice into Tally vouchers and checks every figure first.

3B One XML file imported into a Tally trial company first, then into your live company.

★ Both paths start from the same stored invoice — that is what keeps taxes and books in agreement.

03 What changes for your team

TASK	TODAY — MANUAL	AFTER INTEGRATION — AUTOMATIC
IRN / e-Invoice	Download JSON → upload to GST portal → copy the response → paste it back into the CRM	One click in the CRM. IRN, acknowledgement number and QR return and save themselves.
E-Way Bill	A second manual round trip on a separate portal	Raised immediately after the IRN, with transport details prefilled and validity date stored.
Tally entry	Accounts re-types every invoice into TallyPrime by hand	Pick a date range and branch, export one XML file, import it — all vouchers post at once.
Errors & audit	Mistakes surface late, usually at GST filing time	Balance and GST-rate checks block a bad voucher; every API call is logged and traceable.
Reference integrity	A wrong or invented bill number cannot be detected	The system refuses to save or export a statutory reference that was not genuinely issued.

Five-day setup plan

Day by day: what gets built, and the single test that proves each day is finished.

Working days: 5
Blocking inputs: from you, Day 0
Go-live: end of Day 5
Hypercare: 1 week after

TIMELINE — ONE WORKING WEEK

DAY 1
Foundation & access

Sandbox live, Tally ledgers mapped, data audit done

DAY 2
E-Invoice (IRN)

First real IRN obtained from inside the CRM

DAY 3
E-Way Bill & gates

E-Way Bill raised, 24-hour cancel window enforced

DAY 4
Tally export

Vouchers imported and tied out to the paisa

DAY 5
Test, train, go-live

First live invoice runs the whole chain untouched

Why this order: access first — nothing can be tested without it. Then the statutory path (Days 2–3), because an invoice has no legal validity without its IRN. Then the books (Day 4). Training and go-live last, so nobody is trained on something still moving.

04 Day by day

DAY 1 Foundation & access

- Sandbox test credentials from the GSP partner configured and verified end to end.
- Your Tally chart of accounts collected; every ledger name mapped to the export.
- Existing invoice records audited for compliance data; a cleanup list prepared.

DONE WHEN — the CRM talks to the sandbox, and the ledger map matches your Tally company exactly.

DAY 2 GSP integration — E-Invoice (IRN)

- Secure server-side connection built; credentials are never exposed to the browser.
- IRN generation, cancellation and details lookup implemented and tested against sandbox.
- Manual download-paste replaced by one button; kept as a fallback if the API is down.

DONE WHEN — a test invoice receives a real IRN from the sandbox and is marked Complete in the CRM.

DAY 3 E-Way Bill & compliance gates

- E-Way Bill raised automatically after the IRN, with transport and dispatch details prefilled.
- 24-hour cancellation window enforced in the interface; validity date stored on the invoice.
- Clear error messages, automatic retries, and a log of every API call.

DONE WHEN — a test E-Way Bill is generated with a valid till date, and cancellation after 24 hours is blocked.

DAY 4 Tally export

- Export wired in: choose a date range and branch, download the Tally XML.
- Balance guard, one ledger per GST rate, and a drift report comparing CRM and Tally figures.
- Imported into a Tally trial company; voucher count verified.

DONE WHEN — the Tally Sales register and Trial Balance tie back to the CRM invoice register, to the paisa.

DAY 5 End-to-end test, training & go-live

- Full run on real branch data: invoice → IRN → E-Way Bill → Tally.
- Production credentials swapped in and re-verified after the sandbox passes.
- Owner and accounts team trained; a one-page SOP handed over.

DONE WHEN — the first real invoice completes the whole chain with zero manual data entry.

DAY 0 What we need from you first

- Ledger names** from your TallyPrime company — Chart of Accounts → Ledgers.
- GSP sandbox credentials** and sign-off on the API proposal (4,000 calls/year tier).
- Accountant's call** on the one-paisa CGST/SGST rounding note.

NOTE — these three items are the only things that can delay Day 1. Everything else is on our side.

05 Assumptions, exclusions and cost

- The CRM stays the only billing source — Tally consumes data; no two-way sync to maintain.
- One Tally company on one Windows PC; all three branches are supported from day one.
- Import starts file-based (no always-on gateway); the live gateway can be added later.
- Not in these five days:** purchase and credit-note vouchers, payment allocation splitting, bulk backfill of old invoices.

Cost — nothing new to buy for Tally

GSP APIs — e-Invoice + E-Way Bill + GSTIN, 4,000 calls/year	₹29,500 / yr
On-boarding & support	Free (FOC)
TallyPrime XML import gateway	₹0 — built in
Hosting	Existing — no change
Effective cost per e-invoiced despatch	≈ ₹14.75

An invoice that needs an E-Way Bill uses two calls (one IRN, one E-Way Bill), so the 4,000-call tier covers roughly 2,000 despatches a year.
